Tuta absoluta, an invasive pest that has the potential to wipe out 100 percent of tomato yields, is expected to arrive in Vietnam shortly. Thus, the IPM Innovation Lab conducted two Tuta absoluta awareness workshops there in June, focusing on the pest’s origin, taxonomy, biology, ecology, spread, monitoring, and management. While there, the team also visited local lychee orchards, in addition to attending a dragon fruit workshop organized by New Zealand Aid and the International Symposium on Lychee, Longan, and other Sapindaceae Fruits organized by the International Society for Horticultural Sciences.
